

FOR CENTRALIZED OPERATION

MANTER LINE CONTROL

Line Control communicates with all Manter machines and enables the user to control all machines in a packaging line from one location.

About Manter Line Control

Manter provides an advanced system with an IPC and software that connects Manter's weighing, packaging and palletizing machines. This allows customers to centrally manage their entire production line: they can remotely control and monitor operations.

Line Control contains three key functions:

- Start/stop control of the entire line
- Automatic preset switching for each machine
- Error display with logging

With Line Control, changing packing sizes becomes effortless. For example, when switching from 3 lbs to 8 lbs bags, the system automatically adjusts all machines to the correct presets. After placing the new bags and confirming the recipe, the entire line can be restarted with just one command.

Major benefits

Increasing efficiency

Line Control streamlines Manter's packing line, boosting efficiency.

Shortening changeover times

All presets can be changed at once and Manter's fully automatic machines will adjust accordingly.

Insight in performance

Line Control reduces operator failure significantly and enables the user to make data-driven decisions to optimise production.

Reducing labor costs

With Line Control the management and control of the packaging line will become less labour intensive.
